

A METHOD OF SERVICING RECEPTION OF SOFTWARE BROADCASTED IN A CAROUSEL OF OBJECTS

ABSTRACT OF THE DISCLOSURE

The presented method allows capturing information broadcasted cyclically in the carousel of objects and creating a file system, which is later used by applications, operating for example under control of MHP system. The method is characterized in that from the moment of connecting the receiver to the data stream, the data belonging to the defined carousel are retrieved, in the sequence of broadcast of these data in the stream. After receiving all data, modules are created out of them. These modules are decompressed, and next their content is appended to the file system of the receiver.
